EXPERIMENT

Title

EQUILIBRIUM

Description

You are given an array A of N integers. An equilibrium position is a position where the sum of all integers on its left is equal to the sum of all integers on its right in the array A. Print the index of the equilibrium position.

Note:For any given array there is only a single equilibrium position, if no equilibrium position is found then print "NOT FOUND" without quotes.

The array is 1 indexed.

Input Format:

The input consists of two lines:

The first line contains an integer denoting N.

The second line contains N space-separated integers denoting the elements of the array A.

Input will be read from the STDIN by the candidate

Output Format:

Print the index of the equilibrium position. If no index is found, print "NOT FOUND"

Sample Input

5
2 4 7 3 3

Sample Output

3

Source Code:

```
def find_equilibrium(N, A):
    total_sum = sum(A)
    left_sum = 0

    for i in range(N):
        # Check if the left sum equals the right sum
        if left_sum == (total_sum - left_sum - A[i]):
            # Return the 1-based index
            return i + 1 # Convert to 1-indexed

        left_sum += A[i] # Update left sum for next iteration

    return "NOT FOUND"

# Example usage
if __name__ == "__main__":
    import sys
    input = sys.stdin.read
    data = input().splitlines()

    N = int(data[0]) # The size of the array
    A = list(map(int, data[1].split())) # The array of integers

    result = find_equilibrium(N, A)
    print(result)
```

RESULT

5 / 5 Test Cases Passed | 100 %
